ABSTRACT: This study was conducted in certain area at Khartoum State determine the causative agent of bovine mastitis and the susceptibility of different isolates to different antibiotics use for treatment of bovine mastitis. The total number of dairy cows, which were examined in 34 investigated farms, equals 500. The result as follows: 55% acute mastitis, 44% chronic mastitis and 1% gangrenous mastitis. The isolated genera were as follows: 74% Bacillus spp., 24% Staphylococcus spp., 1% Corynebacterium spp. and 1% Klebsiella spp. The isolated species were as follows: 31% Bacillus coagulans, 11% B. cereus, 9% B. subtilis, 9% B. licheniformis, 4% B. circulans, 2% B. lentus, 3% B. mycoides, 3% B. amyloquefaciens, 2% B. megaterium, 16% Staphylococcus aureus, 8% Staphylococcus hyicus, 1% Corynebacterium spp. and 1% Klebsiella spp. Lastly, the sensitivity test was applied using different antibiotics were as follows: Hundred percent of isolates were sensitive for Chloramphenicol and Ciprofloxacin, 91.6% for Gentamycin and Piperacillin/ Ticaraxime, 85.6% for Vancomycin and Cefoxitin, 75% for Amikacin and Ofloxacin, 66.6% for Ceftizoxime, 33.3% for Co-Trimoxazole and Cephotaxime and 16.6% for Ampicillin/Sulbactam. This study was depended at routine works at microbiological laboratory.

Keywords: Bovine Mastitis, Etiology, Clinical, Treatment, Khartoum, Sudan

INTRODUCTION

Dairy industry has recently grown as a very important economic national source of income. In Sudan, many dairy owners introduced foreign blood. This might result in a progeny of mixed blood cows with lowered resistance to endogenous and locally prevailing diseases such as mastitis. Mastitis is considered the main disease in dairy herds (Kaneen and Bandhard, 1990). Mastitis is the inflammation of the mammary gland due to the injury of any type. However, the udder disease of major concern is that associated with microbial infection (Blood et al., 1983). The most common major pathogens include Staphylococcus aureus, Streptococcus agalactiae, Coliforms, Streptococci and Enterococci, while Corynebacterium bovis were considered to be minor pathogens. In the USA Mycoplasma bovis causes loss of $ 32 per year as a result of the loss of the weight gain and diminished carcass value. (Rosengarten and Citti, 1999; Smith, 1990) reported that 62% of occurrences of clinical mastitis were due to environmental pathogens as coiform bacteria and most species of streptococci. Bovine mortality survey carried out in 1992, identified coliform mastitis as the single most important cause of death in dairy cows (Menzies et al., 1992). The most common coliforms are Escherichia coli, Enterobacter aerogenes and Klebsiella spp. The secretion of the clinically affected quarter is usually brownish and watery (Merk, 1998). Rowan et al. (2003) observed that all strains of Bacillus spp. implicated in mastitis and abortion in animals. Karmy (1990) isolated Streptococcus agalactiae from 5 cases, E. coli from 6 cases and Corynebactrium from 4 cases out of 32 camels suffering from mastitis.

The objectives of the study were: to study the causative agent of mastitis based on clinical examination and apply the sensitivity to various antibiotics on bacterial isolates from mastitic milk samples.

MATERIAL AND METHODS

Sampling

A total of 500 suspected mastitic cows were examined clinically for presence of mastitis. Hundred milk samples from mastitic cows were collected. This was done during period extending from December 2006 to April 2007. Mastitis was diagnosed when there were visible or palpable signs of udder, inflammatory changes in milk secretions, or through bacteriological examination of milk. During the study 100 milk samples were encountered...
from 41 cows suffering from clinical mastitis. Examination of each cow was carried out according to the enclosed questionnaire of bovine mastitis, this questionnaire included data about area, cow, udder and milk. The enclosed questionnaire was to determine the roles played by environment, farm hygiene, ventilation, drainage system, floor type and building of farm as a contribution causing factor for mastitis. Milk samples were taken under critical aseptic condition for bacteriological studies by collection in sterile Bijou bottles after cleaning the outer surface of the udder and teat with potassium permanganate and with cotton wool soaked in 70% alcohol. The fore milk was stripped off and about 5 ml of milk were drawn in sterile Bijou bottle. All samples collected were immediately placed on ice in a thermo flask after collection.

**PH examination**
This test was done to determine milk pH by using of a special paper (manufactured by Kruse Company in Denmark). The test was applied by adding one drop of milk on yellow spot, where in a few seconds the colour was change in positive cases.

**Culture**
The two media used in culture were Blood agar and MacConkey’s agar. Plates were examined for cultural characteristics and biochemical reactions according to standard keys (Barrow and Feltham, 2003).

**RESULTS AND DISCUSSION**

**Questionnaire**
The farmers responded highly to the questionnaire regarding general farm data. The main system applied was semi-intensive system. The ventilation was satisfactory in all farms while in the University of Khartoum and Hilat kuku farms were excellent. Drainage system was satisfactory in all farms except Shambat farms which were poor. Farm housing materials were a mixture between modern and traditional. Type of floor was found ranged between earth and concrete (Table 1).

**PH examination**
A total of 100 milk samples gave a positive reaction to pH paper. Positive sample revealed change in colour from yellow to green or bluish green because the pH of milk will increase to alkaline in infected cows with mastitis, while negative sample revealed no change of the yellow spots or change to light green.

**Clinical status of mammary glands**
The greatest number of type of mastitis was acute mastitis (55%), followed by chronic cases (44%) and gangrenous cases (1%) (Figure 1).

**Bacterial logical examinations**
Four genera of bacteria were isolated from the milk samples. The isolated bacteria were as follows: Bacillus spp. (74%), Staphylococcus spp. (24%), Corynebacterium spp. (1%) and Klebsiella spp. (1%) (Figure 2). Figure (3) showed the percentage of isolated Bacillus spp. from 100 mastitic cows. Figure (4) showed the percentage of isolated Staphylococcus spp., Corynebacterium spp. and Klebsiella spp.

**Sensitivity test**
Figure (5) showed the percentage of effectiveness of different antibiotics against different isolated bacteria (Table 2) showed the name and concentration of antibiotics and degree of effectiveness. Drug susceptibility profiles of aerobic bacterial isolates, including Bacillus spp., Staphylococcus aureus, Staphylococcus hyicus and Klebsiella spp. were subjected to various drugs. Susceptibility of Gentamycin (GM) and Piperacillin/Tazobactam (TZP) were about (91.6%), (83.3%) were susceptible to Pefloxacin (PF) and Tetracycline (TE), (75%) were susceptible to Amikacin (AK) and Ofloxacin (OF), (66.6%) were susceptible to Ceftriaxone (CI), (33.3%) were susceptible to Ceftizoxime (CF), (16.6%) were susceptible to Ampicillin/sulbactam (AS).but the best antibiotics in all this are Chloramphenicol (CH) and Ciprofloxacin (CP) because the percentage of the effectiveness was 100% that mean all isolated organisms are susceptible to these two drugs.

This study was conducted in Omdurman and Khartoum North because these towns are considered as the largest milk producing and marketing. Mastitis is a complex disease caused by several microorganisms.

(+++): Highly sensitive; (++): Moderate sensitive; (+): Poor sensitive; (-): Non sensitive.

Sandholm et al. (1995) and still it’s the most important problem in dairy industry (Dodd 1985; Fetrow and Mann, 1991). Three forms of mastitis were classified in this study acute, chronic and gangrenous mastitis; this classification is different from Philpott (1967) who classified mastitis according to the severity of inflammatory response into four forms peracute, acute, chronic and mild. Most of the surveyed farms were small, so problems of ventilation and drainage have been clearly observed. Most dairy farms building materials were traditional made of mud, wood with old iron sheets for the door. These traditional building may cause an injuries on the udder and teat and hence predispose for mastitis occurrence. The floor surfaces were aclear hazards to the animals. Mud and excessive moisture increase coliform organisms contaminating the udder (William, 1995).

In this study the types of Staph spp. isolated from acute and chronic mastitis were *Staph aureus* and *Staph hyicus*. This agrees with the finding of DaRong et al. (2010); Jan et al. (1998). Radostits et al. (1994) mentioned that *Staph aureus* is the first microorganism incriminated in bovine mastitis. A predominance of *Staph aureus* mastitis in cows has been reported by Watts (1988); Falade et al. (1989) and Carlos (1990). Elsayed (2000) isolated *Staph aureus* and *Staph hyicus* from 499 milk samples from different domestic animals: cows, sheep, goat and camels. AlAyies (2004) isolated *Staph aureus* (73.7%) and *Staph hyicus* (6%) from 100 bovine mastitic milk samples. Isolation of *Klebsiella* spp. in this study is in accord with (Cullor, 1992), who found that 20% of bovine mastitic cases, in Nordic countries caused by coliform of which about 85% were *E. coli* and the rest were *Klebsiella* spp., and other *Enterobacteria* were isolated. This is in agreement with Mc Donald et al. (1970); Ibrahim and Habiballa (1978). To the best of knowledge gangrenous mastitis caused by *Klebsiella* spp. is considered as the first report in Sudan. In this study nine species of *Bacillus* were isolated from acute and chronic mastitis, this in agreement with Jan et al. (1998). The percentage of incidence of *Bacillus coagulans* was high and this confirms the findings of Nail et al. (2003). Also *Bacillus cereus* was also isolated by Nail et al. (2003). Other species of *Bacillus* were isolated like, *B. licheniformes*, and this in accord with results of findings of Logan (1988); Nail et al. (2003); Parvanta (2000). The isolation of *Bacillus alvei, B. subtilis, B. megaterium* and *B. cereus* during this study in agreement with Elgadasi (2003). *B. licheniformis, B. amyloliqufaciens, B. circulans, B. lentus* and *B. mycode*, to the best of our knowledge for the first time to be recorded for mastitis in cow in Sudan.

Figure 3. The percentage of isolated Bacillus spp. from 100 mastitic cows

Figure 4. The percentage of other isolated bacteria from 100 mastitic cows

Figure 5. The percentage of effectiveness of different antibiotics against different isolated bacteria
CONCLUSION

All cases of bovine mastitis should be handled carefully and reported comprehensively with respect to microscopic examination of milk with special emphasis on milk pH, bacterial examination and the effectiveness of different antibiotics against mastitic cases and it is need more an efficient work specially for detect sub-clinical mastitis in the future.

Acknowledgements

First, my thanks are due to almighty Allah, the beneficent and the merciful, who gave me the strength and patience to complete this work. This is impossible to capture in words for every things, that know and which that He almighty know. My thank are due to my supervisor Dr. A/ Basit Osman Ahmed and my co-supervisor Prof. Imadeldeen E. Aradaib for their generosity and willingness in sparing time for supervision. My thanks to Prof. Mohammed Suleiman Elsanousi for his help in bacteriological work. My thanks are extended to the members of the Department of Microbiology and the Department of Medicine, Pharmacology and Toxicology. I wish to thank the technical staff of Department of Preventive Medicine and Public Health. I wish to thank German Academic Exchange Service (DAAD) for sponsoring my scholarship. The help of the staff at all farms where this study was performed is gratefully acknowledge. I wish to express my special sincere thanks to my family my father, mother, sister and brothers. I would like to convey my special thanks to Mr. Mukhtar Ali for help in collection of samples.
